Characteristic Polytope of Graphs

Mingzhi Zhang

1 Characteristic Polytope

1.1 Characteristic vectors of subsets

Fix a positive integer n, and let $[n] := \{1, 2, \dots, n\}$. To any subset $S \subseteq [n]$, we associate the *characteristic vector*:

$$\chi_{S} = (\chi_{S}(1), \chi_{S}(2), \dots, \chi_{S}(n))$$

where

$$\chi_S(i) = \begin{cases} 1, & i \in S \\ 0, & i \notin S \end{cases}$$

Given a simplicial complex Δ over [n], we associate to each face $\tau \in \Delta$ its characteristic vector χ_{τ} and get the characteristic polytope as follows:

Definition 1.1.1. The **characteristic polytope** $P_{\chi}(\Delta) \subset \mathbb{R}^n$ of Δ is the convex hull of its characteristic vectors:

$$P_\chi(\Delta)=\text{conv}\{\chi_\tau\mid \tau\in\Delta\}.$$

1.2 Characteristic polytope of a graph

We view a graph G with vertices [n] as a simplicial complex. For any graph we can build a characteristic polytope as defined above. In what follows we will first do a few examples and then focus on two graphs, namely the complete graph K_n and the cycle graph C_n .

1.2.1 Example: Empty graph E_n

The empty graph E_n has no edges, and thus its faces are only the vertices and empty set. The characteristic polytope of E_n is given by:

$$P_{\chi}(E_n) = conv\{0, \chi_i \mid i \in [n]\}.$$

Clearly, this is just the convex hull of the unit vectors together with the origin $\mathbf{0}$ in \mathbb{R}^n , which is the standard simplex Δ_n .

1.2.2 Example: Complete graph K_n

The complete graph K_n has all subsets of [n] with cardinality at most 2 as its faces. The characteristic polytope of K_n is given by:

$$P_{\chi}(K_{\mathfrak{n}}) = conv\{\chi_{S} \mid S \subseteq [\mathfrak{n}], |S| \leqslant 2\}.$$

1.2.3 Example: Cycle graph C_n

The cycle graph C_n has faces corresponding to all subsets of vertices that induce a closed walk. The characteristic polytope of C_n is given by:

$$P_\chi(C_\mathfrak{n})=\text{conv}\{\chi_S\mid S\subseteq [\mathfrak{n}]\text{, induces a closed walk}\}.$$

1.3 h*-vector of the characteristic polytope

We are mainly interested in the unimodality of the h*-vector of the characteristic polytopes.
